Golf on the Gold Coast | Rationale

Brayden Hoyle | QUT | DXB111 - Introduction to Web Design

Concept Statement

Golf on the Gold Coast is a responsive website helping teenagers aged 13-17 discover local driving ranges and golf courses. It gathers key info on venues covering pricing, equipment, supervision, and transport information, to help visitors plan a visit.

Four destinations are grouped between two categories to help visitors find their ideal golf experience and activity, with breadcrumbs and related links used to help visitors better understand their site-location and the path back.

My mood board inspired my cream, off-white and green palette, along with the gold highlighting in hero headings, with rounded cards grouping bite-sized text and images to create an approachable tone and a clear visual flow.

I planned mobile-first designed wireframes, rearranging cards at wider screen sizes to reduce visual crowding, improving consistency across all eight pages.

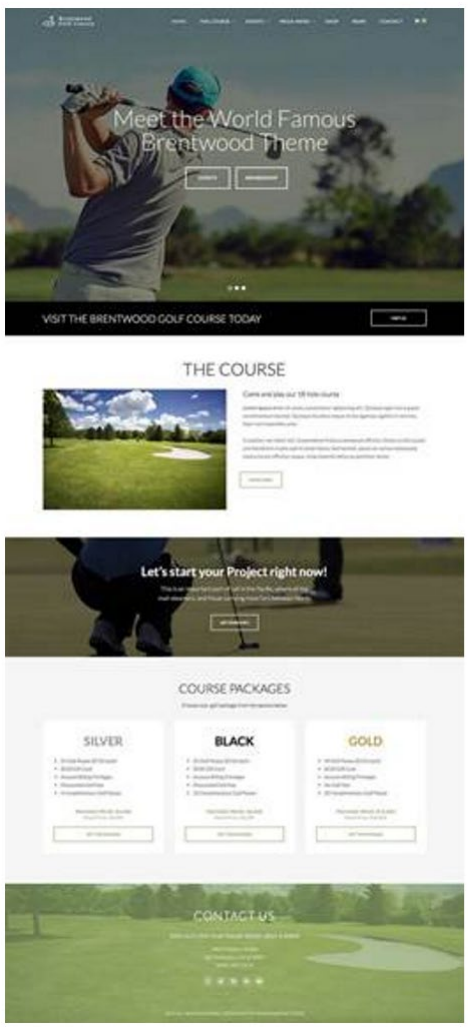

Target Audience

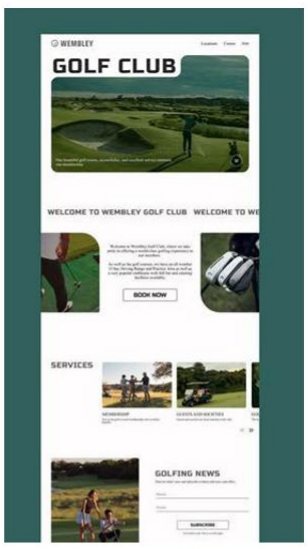

My primary audience focuses on teenagers aged 13-17 living on or visiting the Gold Coast, particularly beginners and casual players planning outings with family or friends.

Before visiting each venue, they require information regarding pricing, equipment hire, transport and other facts such as whether a parent or guardian must accompany them. I visually prioritised some on each page as rounded hero badges above each page header and quick-fact cards featuring icons paired with focused text for quick scanning.

I utilised direct, to the point language in short paragraphs, aiming to make the information approachable and an easier read, with my use of mobile-first layouts responsively adapting the content for phones, tablets and desktop screens.

Key Highlights

1
Used short, friendly wording so teens can quickly understand each section.

2
Aria-label used globally, with special icons like the arrow being wrapped in aria-hidden so screen-readers aren't impacted.

3
I darkened hero photos after contrast testing so white text stays readable.

4
Hero badges show age range and location before any reading.

5
Breadcrumbs show your current site location and help provide a clear path back.

6
Matching card layouts help teens compare venues more efficiently.

7
Cards and images help break the content into smaller sections with clear purposes.

8
Cropped images keep their subject in view at every screen resolution.

9
Button texts detail the names of each venue, so every link is clear where it leads.

10
Sticky logo & navigation bar keep every category accessible in a single click.

11
Quick facts for each venue sit in brief icon fact cards, each wrapped in rows with a flexbox.

12
Icons are paired with text labels, so meaning never relies on symbols alone.

13
Large link buttons give one-tap routes to website, map and Instagram.

Design Reflection

My first goal when designing this site was navigation that was visually consistent and accessible, positioning it across the hero's bottom border, then below the logo bar when scrolling down the page. Initially, I faced multiple conflicting heights, as well as offsets and stacking values resulting in problems with overlap.

I tested different positioning values in the browser across each of the screen sizes, helping me understand document flow, on top of sticky offsets and flex stacking order. I also adjusted the scroll padding so that same-page links did not position content beneath the navigation and header, and shared :root CSS variables helped ensure navigation spacing remained consistent and met the WCAG guidelines.

Overall, designing for multiple screen-view sizes has showed me how responsive positioning of page elements must account for both visual layout and access to content, as well as with how it is the important layout decisions that also affect usability, not just appearance or aesthetic.

GenAI Reflection

How

When planning my project, I utilised Perplexity AI as a learning aid, asking questions and requesting explanations when I was unsure about HTML and CSS concepts I believed I may have to use in various sections I wanted to implement from my wireframes.

What

It helped me compare different CSS properties to more firmly grasp when they, and other different HTML attributes might be more or less appropriate in across different scenarios, solidifying my understanding of the class content so I could apply it during the project's development.

Where

These explanations supported my understanding of responsive layouts, navigation and semantic html whilst in the beginnings and early process of the project's development. I also used GenAI to help structure my concept for the rationale against the brief and rubric to help me gain a firm grasp of the path forward.
